### Advanced R Programming - Bonus Lecture

Krzysztof Bartoszek (slides by Leif Jonsson, Måns Magnusson, and Arash Haratian)

Linköping University krzysztof.bartoszek@liu.se

29 August 2023

#### **Today**

- Data munging
- Machine Learning
- Supervised learning in R
- Probability in R
- Big data

## Tidy data

Tidy data and messy data

#### Tidy data

Data munging

- 1. Each variable forms a column
- 2. Each observation forms a row
- 3. Each type of observational unit forms a table

## Tidy data

Data munging

- 1. Each variable forms a column
- 2. Each observation forms a row
- 3. Each type of observational unit forms a table

Examples: iris, faithful and gapminder

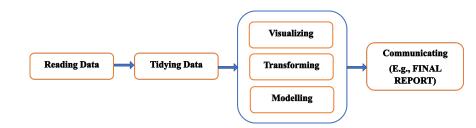

### Why tidy?

Data munging

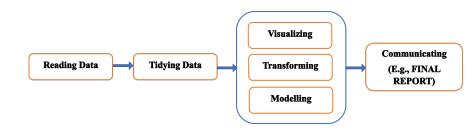

80 % of Big Data work is data munging

### Why tidy?

80 % of Big Data work is data munging

Analysis and visualization is based on tidy data

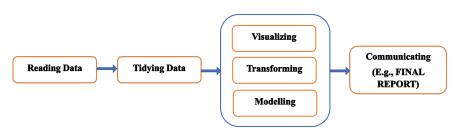

# Why tidy?

Data munging

80 % of Big Data work is data munging

Analysis and visualization is based on tidy data

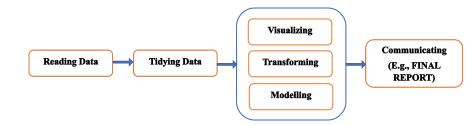

Performant code

### Data analysis pipeline

Messy data  $\rightarrow$  Tidy data  $\rightarrow$  Analysis

### dplyr

Data munging

Verbs for handling data

Highly optimized C++ code (backend)

Handling larger datasets in R (no copy-on-modify)

- mutate(): Adds new columns that are functions of existing columns
- transmute(): Adds new columns that are functions of existing columns, and then it removes the existing ones
  - select(): Picks columns based on their names
  - filter(): Picks rows based on their values
- group\_by() and summarise(): Reduces multiple rows down to a single summary
- arrange(): Changes the ordering of the rows

Data munging

#### tidyr

Another package for tidying the data:

- separate(): Separates a character column into multiple columns with a regular expression or numeric position
  - extract(): Creates new columns from a character column given a string or Regex
- pivot\_wider(): Increases the number of columns by collecting the informations that are spread along the rows
- pivot\_longer(): Increases the number of rows by collecting the informations that are spread along the columns

#### dplyr+tidyr

The cheatsheet: https://www.rstudio.com/wp-content/uploads/2015/02/data-wrangling-cheatsheet.pdf

These two packages should be used to turn a messy data into a tidy data.

#### Messy data

Data munging

1. Column headers are values, not variable names.

```
(new_sp_m014 - new_rel_f65 in who dataset)
```

The column names contain:

 $\verb"new-{method of diagnosis}-{gender}{age group}$ 

```
tidvr::who
#> # A tibble: 7,240 X 60
      country
                   iso2
                                   year new_s...1 new_s...2 new_s...3 new_s...4
                          iso3
#>
      <chr>>
                    \langle chr \rangle \langle chr \rangle \langle int \rangle
                                           \langle int \rangle
                                                     \langle i, n, t, \rangle
                                                              \langle int \rangle
                                                                       \langle int \rangle
                           AFG
#> 1 Afghanistan AF
                                  1980
                                               NA
                                                                 NA
                                                                          NA
#> 2 Afghanistan AF
                         AFG 1981
AFG 1982
                                                        NA
                                                                 NA
                                               NA
                                                                          NA
   3 Afahanistan AF
                                               NA
                                                        NA
                                                                 NA
                                                                          NA
                         AFG 1983
   4 Afghanistan AF
                                               NA
                                                       NA
                                                                 NA
                                                                          NA
                                1984
    5 Afahanistan AF
                          AFG
                                               NA
                                                        NA
                                                                 N A
                                                                          NA
    ... with 7,230 more rows, 50 more variables: new_sp_m65 <int>,
#> #
       new\_sp\_f014 <int>, new\_sp\_f1524 <int>, new\_sp\_f2534 <int>,
#> #
       new_sp_f3544 <int>, new_sp_f4554 <int>, new_sp_f5564 <int>,
       new_sp_f65 < int>, new_sn_m014 < int>, new_sn_m1524 < int>,
#> #
#> #
       new_sn_m2534 <int>, new_sn_m3544 <int>, new_sn_m4554 <int>,

       new sn m5564 <int>. new sn m65 <int>. new sn f014 <int>.
#> #
       new_sn_f1524 <int>, new_sn_f2534 <int>, new_sn_f3544 <int>, ...
```

Big data

#### Messy data

Data munging

 Column headers are values, not variable names. (new\_sp\_m014 - new\_rel\_f65 in who dataset)
 Solution: The tidyr::pivot\_longer() can be used:

```
library(tidyverse)
long_who <- who %>%
  pivot_longer(
    cols = new_sp_m014:newrel_f65,
    names_to = "column_info",
    values_to = "cases",
    values_drop_na = TRUE
#> # A tibble: 76.046 X 6
#>
      country
                 iso2 iso3
                                year column_info
                                                   cases
                  <chr> <chr> <chr> <int> <chr>
                                                   \langle int \rangle
    1 Afghanistan AF
                         AFG
                                1997 new sp m014
    2 Afghanistan AF
                        AFG
                               1997 new_sp_m1524
                                                      10
    3 Afghanistan AF AFG
                              1997 new_sp_m2534
    4 Afghanistan AF
                        AFG
                             1997 new_sp_m3544
    5 Afghanistan AF
                        AFG
                                1997 new_sp_m4554
#> # ... with 76,041 more rows
```

Big data

Data munging

- 1. Column headers are values, not variable names.
- Multiple variables are stored in one column. (The new column column\_info in previous slide!) The column contains:
  - method of diagnosis
  - gender
  - age group

#### Messy data

Data munging

- 1. Column headers are values, not variable names.
- 2. Multiple variables are stored in one column.

(The new column column\_info in long\_who!)

**Solution:** The tidyr::separate() can be used:

```
tidy_who <- long_who %>%
 # SOME OBSERVATIONS ARE STORED AS 'newrel' instead of 'new rel'
  # SO WE HAVE TO TAKE CARE OF THAT FIRST
 mutate(
   column_info = stringr::str_replace(column_info, "newrel", "new_rel")
 ) %>%
 separate(column_info, c("new", "method", "sexage")) %>%
 select(-new, -iso2, -iso3) %>%
 separate(sexage, c("sex", "age"), sep = 1)
#> # A tibble: 76,046 X 6
  country year method sex
                                    aae
                                          cases
#> <chr>
                \langle int \rangle \langle chr \rangle
                              <chr> <chr> <int>
#> 1 Afghanistan 1997 sp
                                    014
#> 2 Afghanistan 1997 sp
                              m 1524
                                             10
#> 3 Afghanistan 1997 sp m 2534
                                            6
   4 Afghanistan 1997 sp
                                              3
                              m 3544
   5 Afghanistan 1997 sp
                                    4554
```

#> # ... with 76,041 more rows

Bonus

Big data

Data munging

- 1. Column headers are values, not variable names.
- 2. Multiple variables are stored in one column.
- 3. Variables are stored in both rows and columns. (crimetab)
- 4. Multiple types of observational units are stored in the same table.
- 5. A single observational unit is stored in multiple tables.

### Regular Expressions

Language for manipulating strings

Find strings that match a pattern

Extract patterns from strings

Replace patterns in strings

Component in many functions (grep, gsub, stringr::, tidyr::)

Bonus

Data munging

# Regular Expressions - Syntax

fruit <- c("apple", "banana", "pear", "pineapple")</pre>

Symbol	Description	Example
?	The preceding item is op-	grep("pi?",fruit)
	tional and will be matched	
	at most once	
*	The preceding item will be	grep("pi*",fruit)
	matched zero or more times	
+	The preceding item will be	<pre>grep("pi+",fruit)</pre>
	matched one or more times	
n	The preceding item is	$grep("p{2}",fruit)$
	matched exactly n times	

### Regex Examples - Finding matching

```
library(gapminder)
grep("we", gapminder$country)
#> [1] 1465 1466 1467 1468 1469 1470 1471 1472 1473 1474
#> [11] 1475 1476 1693 1694 1695 1696 1697 1698 1699 1700
#> [21] 1701 1702 1703 1704
grep("we", gapminder$country, value=TRUE)
#> [1] "Sweden" "Sweden" "Sweden" "Sweden"
#> [5] "Sweden" "Sweden" "Sweden" "Sweden"
   [9] "Sweden" "Sweden" "Sweden" "Sweden"
#>
#> \[ \sqrt{13} \] "Zimbabwe" "Zimbabwe" "Zimbabwe" "Zimbabwe"
#> [17] "Zimbabwe" "Zimbabwe" "Zimbabwe" "Zimbabwe"
#> [21] "Zimbabwe" "Zimbabwe" "Zimbabwe" "Zimbabwe"
```

Data munging

### Regex Examples - Finding matching

Same results with pipe operator (%>%):

```
library(gapminder)
library(tidvverse)
gapminder %>%
  select(country) %>%
  unlist() %>%
  grep(pattern = "we")
    [1] 1465 1466 1467 1468 1469 1470 1471 1472 1473 1474
  [11] 1475 1476 1693 1694 1695 1696 1697 1698 1699 1700
#> [21] 1701 1702 1703 1704
gapminder %>%
  select(country) %>%
  unlist() %>%
  grep(pattern = "we", value=TRUE)
#> countru1465
               country1466 country1467 country1468 country1469 country1470
#>

                                                                  "Zimhahme"
```

Big data

Data munging

```
library(tidyverse)
# EXTRACTING THE FIRST WORD WITH '[a-z]+' AS THE EXPRESSION
c("The 13 Cats in the Hats are 17 years",
 "4 scores and 7 beers ago") %>%
str extract("[a-z]+")
#> [1] "he" "scores"
# EXTRACTING ALL THE WORDS WITH 'str extract all()'
c("The 13 Cats in the Hats are 17 years",
 "4 scores and 7 beers ago") %>%
 str extract all("[a-z]+")
#> [[1]]
#> [1] "he" "ats" "in" "the"
                                      "ats"
                                              "are" "years"
#> [[2]]
#> [1] "scores" "and" "beers" "ago"
# EXTRACTING ANY DIGITS WITH '[0-9]+' AS THE EXPRESSION
c("The 13 Cats in the Hats are 17 years",
 "4 scores and 7 beers ago") %>%
str extract("[0-9]+")
#> [1] "13" "/."
```

### Regex Examples - Extraction: More complecated Regex

```
library(tidvverse)
#THE STARTING WORD OF THE FIRST 10 SENTENCES
stringr::sentences[1:10] %>%
    str_extract("[A-Z]+[a-z]*")
#> [1] "The"
                             " T t. "
                                       "These"
                                                 "Rice"
                                                            "The"
                                                                      "The"
                   "Glue"
#> [8] "The"
                  "Four"
                             " A "
# NOUNS OF THE FIRST 10 SENTENCES
noun_regex_pattern <- "(a|the) ([^ ]+)"
sentences[1:10] %>%
  str_subset(noun_regex_pattern) %>%
  str_match(noun_regex_pattern)
                     ſ.21 [.31
        Γ.17
#> [1.] "the smooth" "the" "smooth"
#> [2,] "the sheet" "the" "sheet"
#> [3,] "the depth" "the" "depth"
#> [4,] "a chicken" "a" "chicken"
#> [5,] "the parked" "the" "parked"
```

```
library(tidyverse)
print(tidyr::table3)

Supervised learning

Unsupervised learning

Reinforcement learning

# Supervised learning

(also called predictive learning)

response variable

covariates/features

training set

$$D = (x_i, y_i)_{(i=1)}^N$$

If  $y_i$  is categorical: classification

> If  $y_i$  is real: regression

(also called knowledge discovery)

dimensionality reduction

latent variable modeling

$$D=(x_i)_{(i=1)}^N$$

clustering, PCA, discovering of graph structures

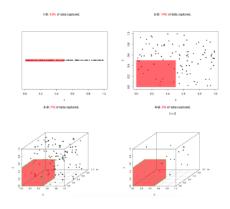

data visualization

The more variables the larger distance between datapoints

Euclidian metric

$$d^{2}(\vec{x}, \vec{y}) = (x_{1} - y_{1})^{2} + (x_{2} - y_{2})^{2} + (x_{3} - y_{3})^{2} + (x_{4} - y_{4})^{2} + \dots$$

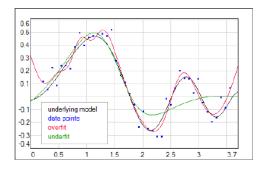

# Curse of dimensionality

http://www.newsnshit.com/curse-of-dimensionality-interactive-demo/

# Fit (bias) and variance in ML

Underfit = bad fit, low variance Overfit = good fit, high variance

NetMaker (Neural networks simulator and designer by Robert Sulej, Warsaw Univ. Tech.):

fit and variance - tradeoff

fit and variance - tradeoff

hyper parameters

fit and variance - tradeoff

hyper parameters

generalization error

fit and variance - tradeoff

hyper parameters

generalization error

validation set/cross validation

fit and variance - tradeoff

hyper parameters

generalization error

validation set/cross validation

information criteria: model fit penalized for model dimensionality

### Predictive modeling pipeline

- 1. Set aside data for test (estimate generalization error)
- 2. Set aside data for validation (if hyperparams)
- 3. Run algorithms
- 4. Find best/optimal hyperparameters (on validation set)
- 5. Choose final model
- 6. Estimate generalization error on test set

#### No free lunch

different models work in different domains

#### No free lunch

different models work in different domains

accuracy-complexity-intepretability tradeoff

#### No free lunch theorem

different models work in different domains accuracy-complexity-intepretability tradeoff ...but more data always wins

# **Probability Functions**

Prefix	Description	Example
r	Random draw	rnorm
d	Density function	dbinom
q	Quantile function	qbeta
р	CDF	pgamma

### Big data

#### Today's trend:

- whole genome
- surveillance cameras (CCTV)
- Internet traffic
- credit card transactions
- everything communicating with everything

$$O(N)$$
 10<sup>12</sup>

$$O(N)$$
  $10^{12}$   $O(N^2)$   $10^6$ 

$$O(N)$$
  $10^{12}$   $O(N^2)$   $10^6$   $O(N^3)$   $10^4$ 

$$O(N)$$
  $10^{12}$   $O(N^2)$   $10^6$   $O(N^3)$   $10^4$   $O(2^N)$  50

... to computational complexity

$$O(N)$$
  $10^{12}$   $O(N^2)$   $10^6$   $O(N^3)$   $10^4$   $O(2^N)$  50

We need algorithms that scale!

$O(P^2 * N)$	Linear regression
$O(N^3)$	Gaussian processes
$O(N^2)/O(N^3)$	Support vector machines
O(T(P * N * log(N)))	Random forests
O(1 * N)	Topic models

## Big data in R

R stores data in RAM

#### R stores data in RAM

integers

4 bytes

numerics

8 bytes

### Big data in R

#### R stores data in RAM

integers 4 bytes numerics 8 bytes

A matrix with 100M rows and 5 cols with numerics  $100000000 * 5 * 8/(1024^3) \approx 3.8GB$ 

```
help(Memory); help("Memory-limits")
Genome storage ... ?
